

## **Cleaning & Maintenance for Showers**

### **Hardware Products**

To maintain the high quality finish of the hardware products special care should be taken with cleaning, if neglected it will spoil with the buildup of mineral deposits in the water leaving your investment looking very dull. After the first month please check that all fasteners are tight, they will need to be re-tightened from time to time as the gaskets settle.

The easiest way to preserve the as new appearance is to wipe dry with a towel after every showering, this will prevent staining and accumulation of deposits

We recommend following every 5-7 showers (weekly) if the hardware has not been dried off after each shower the hardware is cleaned using a mild soap solution applied with a soft cloth, it should be rinsed with clean water & dried off using a micro fibre cloth, seals can be removed for full cleaning & will discolour over time, replacements are available on our on-line website

NEVER under any circumstances use abrasive cleaning cloths or products, they will ruin the surface and spoil the appearance of the product, NEVER use caustic or aggressive chemicals to clean, these will attack the surface & could cause staining or discolouration, it also voids the warranty.

### **Glass Products**

As well as caring for the hardware the glass also needs to be maintained to keep the as new appearance, if possible following showering it should be dried using a blade type squeegee, this will prevent water staining, the build-up of soap scum and dirt, following this regime will keep the glass as new for the life of the shower. If this is not possible to do this after every shower it needs to be cleaned after every 5-7 showers using a mild soap solution with a soft cloth, then rinse with clean water and dry off the glass with a micro fibre cloth. Once every six weeks following the cleaning it is recommended to clean the glass & hardware with Windolene Original Cream glass cleaner, this provides a polish like barrier that makes cleaning easier & reduces the effort required during cleaning.

NEVER strike or hit the exposed edges of the glass, although Toughened safety glass is 5 times stronger than normal glass it can shatter if exposed to heavy impact on its edge, NEVER under any circumstances use abrasive cleaning cloths or products, they will ruin the surface and spoil the appearance of the product, NEVER use caustic or aggressive chemicals to clean, these can attack the surface & could cause staining or discolouration, it also voids the warranty.
